

DATA ANALYSIS

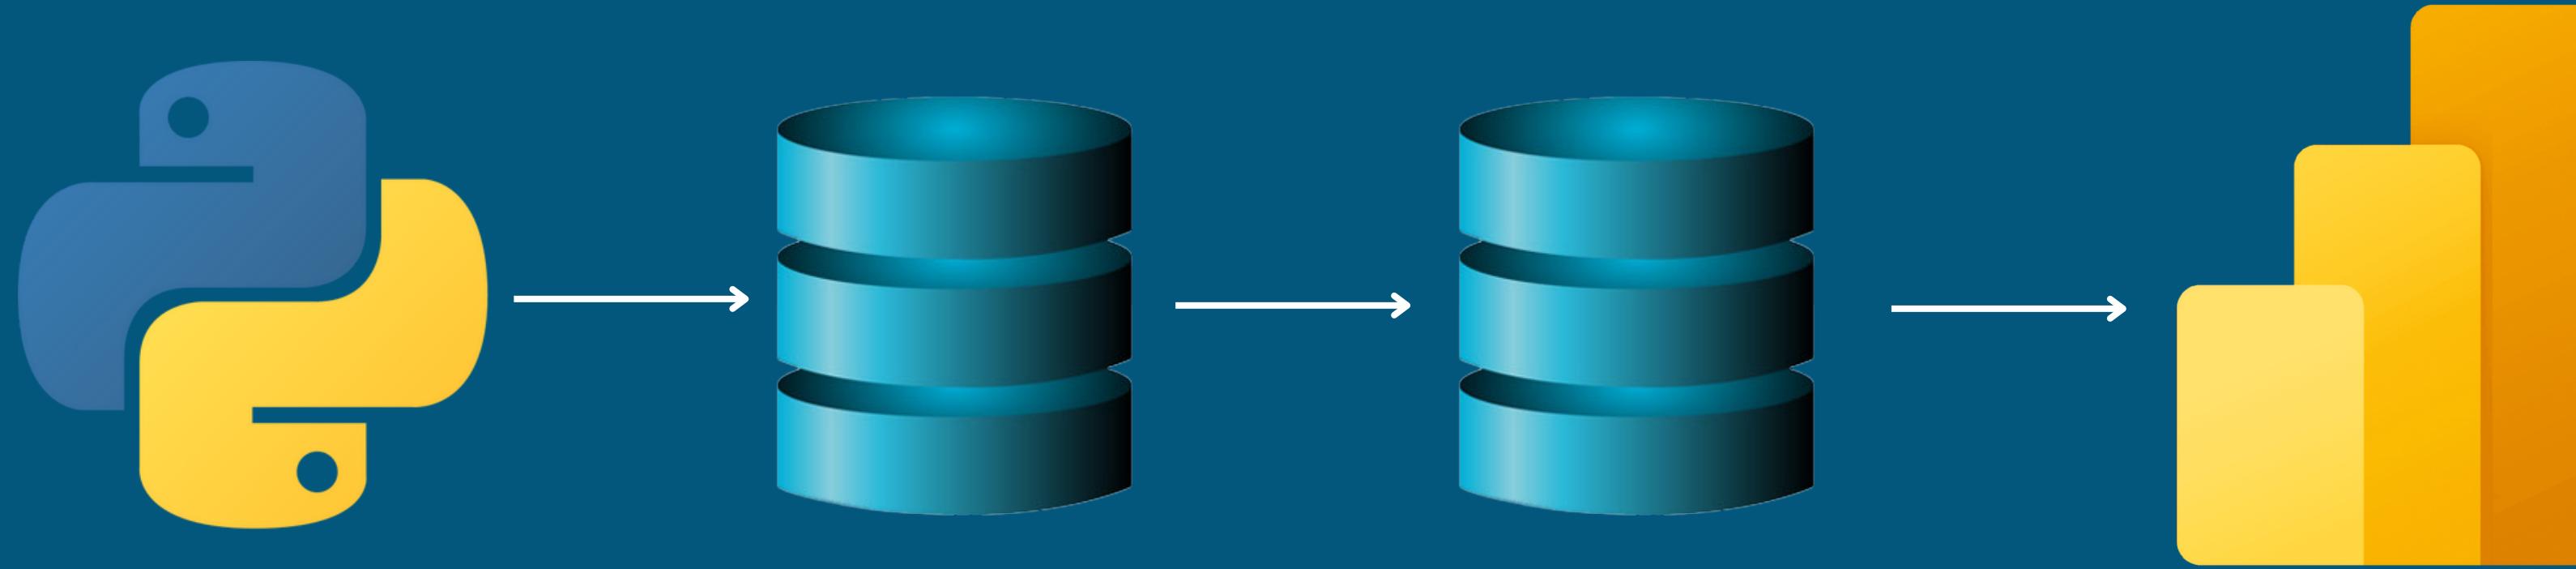

PROJECT: SENSOR DATA ANALYSIS

MY TASK?

TASK STRUCTURE

Python

We generate sensor data for process.

Database A

We scrap sensor data in normal form from Python to Database A.

Database B

In Database B, we get data in denormalize form from Database A.

Power BI

Finally, we visualize sensor data with Power BI.

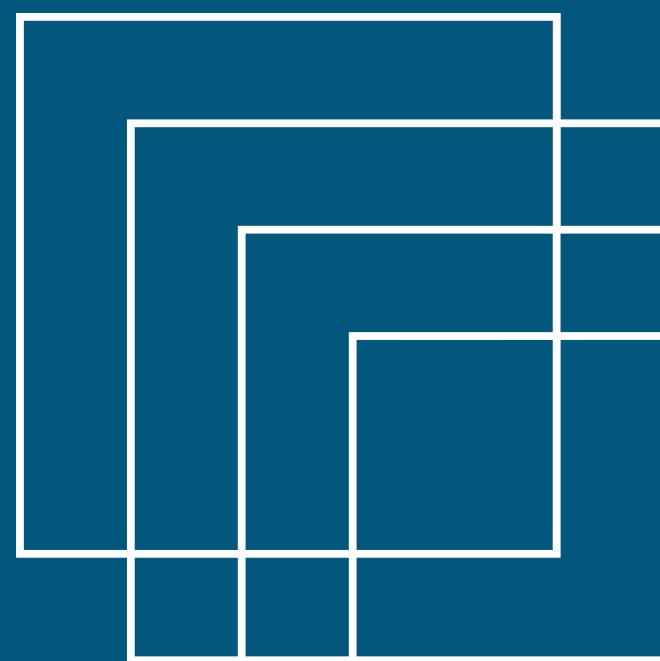

CONTENT

01

02

TECHNICAL SIDE

BUSINESS SIDE

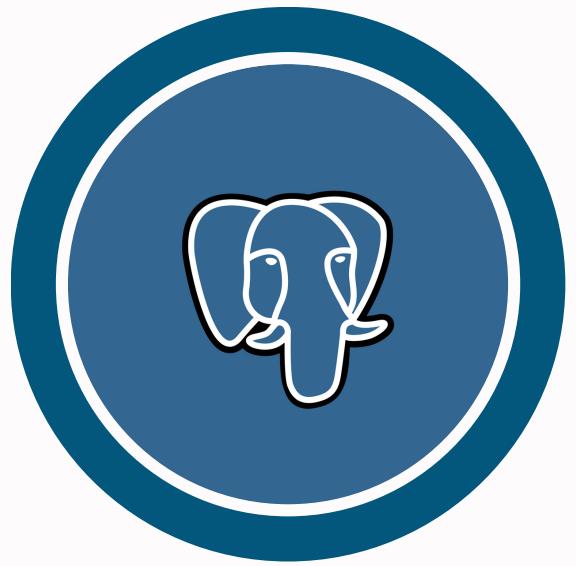

TOOLS:

PYTHON

Generate data /
Send to database

PostgreSQL

Create database /
Using pgagent jobs

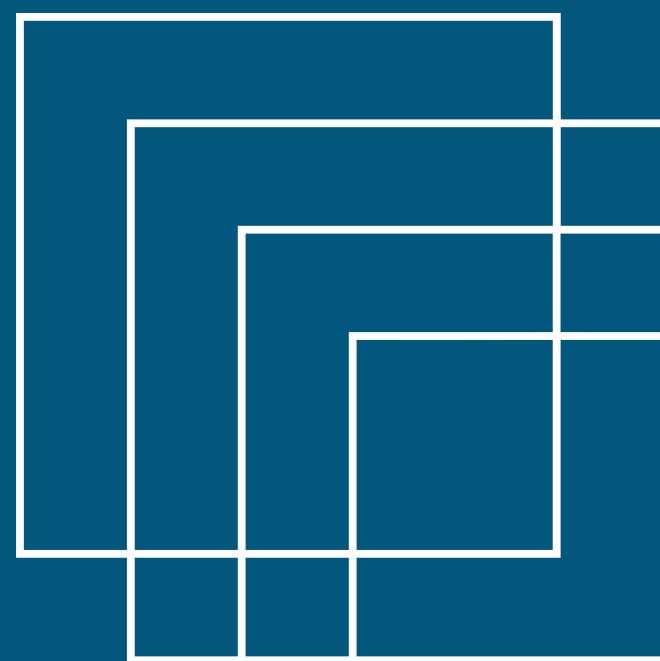

Power BI

Data visualization

TECHNICAL SIDE

PROCESS

- 01** GENERATION OF SENSOR DATA
- 02** CONNECT TO DATABASE A
- 03** CREATE DATABASE B
- 04** INSTALL PG AGENT
- 05** CONNECT WITH POWER BI
- 06** RESULT

COLUMNS:

TEMPERATURE

WIND SPEED

HUMIDITY

WIND_DIRECTION

SOLAR RADIATION

SOIL MOISTURE

TEMPERATURE

SOIL PH LEVELS

NUTRIENT LEVELS

PYTHON

01

```
import psycopg2
import random

while True:
    # Insert data into soil_sensor
    insert_sscript = 'INSERT INTO soil_sensor (id, soil_moisture_content, soil_
soil_moisture_content = random.uniform(10, 50)
soil_pH_levels = random.uniform(5.5, 7.0)
soil_temperature = random.uniform(5, 40)
nutrient_levels = ['N', 'P', 'K']
soil_nutrient_levels = random.choice(nutrient_levels)
insert_svalue = (id, soil_moisture_content,soil_pH_levels,soil_temperature,
cur.execute(insert_sscript,insert_svalue)

conn.commit()
id += 1
time.sleep(10)
```

We generate data in python using 'while loop'. When we create this data, we set the limits for the features accordingly. Example: (temp Min: 0 , Max: 40) , (wind speed Min: 0 , Max: 30) etc.

COLUMNS AND VALUE RANGE:

| | | | | | |
|------------------------|---|----------|------------------------|---|-----------------|
| <i>TEMPERATURE</i> | - | (0,40) | <i>SOIL MOISTURE</i> | - | (10,50) |
| <i>WIND SPEED</i> | - | (0,30) | <i>TEMPERATURE</i> | - | (5,40) |
| <i>HUMIDITY</i> | - | (30,80) | <i>SOIL PH LEVELS</i> | - | (5.5,7.0) |
| <i>WIND_DIRECTION</i> | - | (0,360) | <i>NUTRIENT LEVELS</i> | - | [‘N’, ‘P’, ‘K’] |
| <i>SOLAR RADIATION</i> | - | (0,2000) | | | |

02

We are contacting database A. Then we send the data generated by python to the database. For this we use the "psycopg2" library.

```
import psycopg2
import random
import time
# Let's define your PostgreSQL database connection parameters
host = 'localhost'
database = 'databaseA'
username = 'postgres'
pwd = 'eriya494949'
port = 5432
conn = None
cur = None

conn = psycopg2.connect(
    host=host,
    dbname=database,
    user=username,
    password=pwd,
    port=port
)
cur = conn.cursor()
```

Check-up...

Tables (2)

- soil_sensor
- weather_sensor

| | id [PK] integer | soil_moisture_content double precision | soil_ph_levels double precision | soil_temperature double precision | soil_nutrient_levels character varying (10) |
|---|---------------------------|--|---|---|---|
| 1 | 1 | 34.976367805933165 | 6.026315932107942 | 9.785870049288185 | N |
| 2 | 2 | 20.8926517072365 | 6.951530980908673 | 16.554476617225312 | K |
| 3 | 3 | 48.75662559204609 | 5.811128472497669 | 17.545042149707164 | K |

| | id [PK] integer | temperature double precision | wind_speed double precision | humidity double precision | wind_direction double precision | solar_radiation double precision |
|---|---------------------------|--|---------------------------------------|-------------------------------------|---|--|
| 1 | 1 | 37.50818659144495 | 19.870317969893357 | 60 | 299.5789644899922 | 325.0176853954021 |
| 2 | 2 | 17.125175657123727 | 1.495384839464664 | 54 | 269.16792491312094 | 275.74438432502825 |
| 3 | 3 | 29.222790670553273 | 14.508518157274528 | 51 | 125.02904192657596 | 1706.5261572720283 |

METHOD

1

03

OPERATION:

- We write all operation in Python which :
- 1) Create Table in DatabaseB
- 2) Create Link Between DatabaseB and DatabaseA
- 3) Adding Data To DatabaseB

```
#Next, establish a connection to databaseB
connect = """SELECT dblink_connect('myconn1',
'dbname=databaseA port=5432 host=localhost user=postgres password=eriya494949');
"""

```

```
#Now, you can execute queries on databaseB from databaseA
add_to_b = f"""insert into raw_data(w_temperature, wind_speed, w_humidity, wind_
SELECT *
FROM dblink('myconn1',
'SELECT w.temperature, w.wind_speed, w.humidity, w.wind_direction, w.solar_radia
AS p(temperature FLOAT, wind_speed FLOAT, humidity FLOAT, wind_direction FLOAT,
"""

```

1

2

? BUT HOW WE DETERMINE SCHEDULES?

```
import datetime

current_date = datetime.date.today()
day_of_week = current_date.weekday() + 1
if day_of_week in [6, 7]:
    print(f"Day of the week (number): {day_of_week}.\n    |    | No reporting today.")
continue
```

Week day (Exception)

METHOD 2

POSTGRESQL

03

```
-- First, let's create the dblink extension if not already created
CREATE EXTENSION IF NOT EXISTS dblink;

SELECT dblink_connect('myconn',
    'dbname=databaseA port=5432 host=localhost
        user=postgres password=eriya494949');

insert into raw_data(w_temperature, wind_speed, w_humidity,
    wind_direction, solar_radiation, sensor_id,
    soil_moisture_content, soil_pH_levels, soil_temperature,
    soil_nutrient_levels)

SELECT *
FROM dblink('myconn',
    'SELECT w.temperature, w.wind_speed, w.humidity, w.wind_direction,
        w.solar_radiation, s.id, s.soil_moisture_content, s.soil_pH_levels,
        s.soil_temperature, s.soil_nutrient_levels FROM soil_sensor s
        INNER JOIN weather_sensor w ON s.id = w.id')
AS p(temperature FLOAT, wind_speed FLOAT, humidity FLOAT, wind_direction FLOAT,
    solar_radiation FLOAT, id INT, soil_moisture_content FLOAT,
    soil_pH_levels FLOAT, soil_temperature FLOAT, soil_nutrient_levels VARCHAR(10));
```

In the 3rd stage, we denormalize and move the data from database A to database B. We will use DatabaseB for visualization.

Check-up...

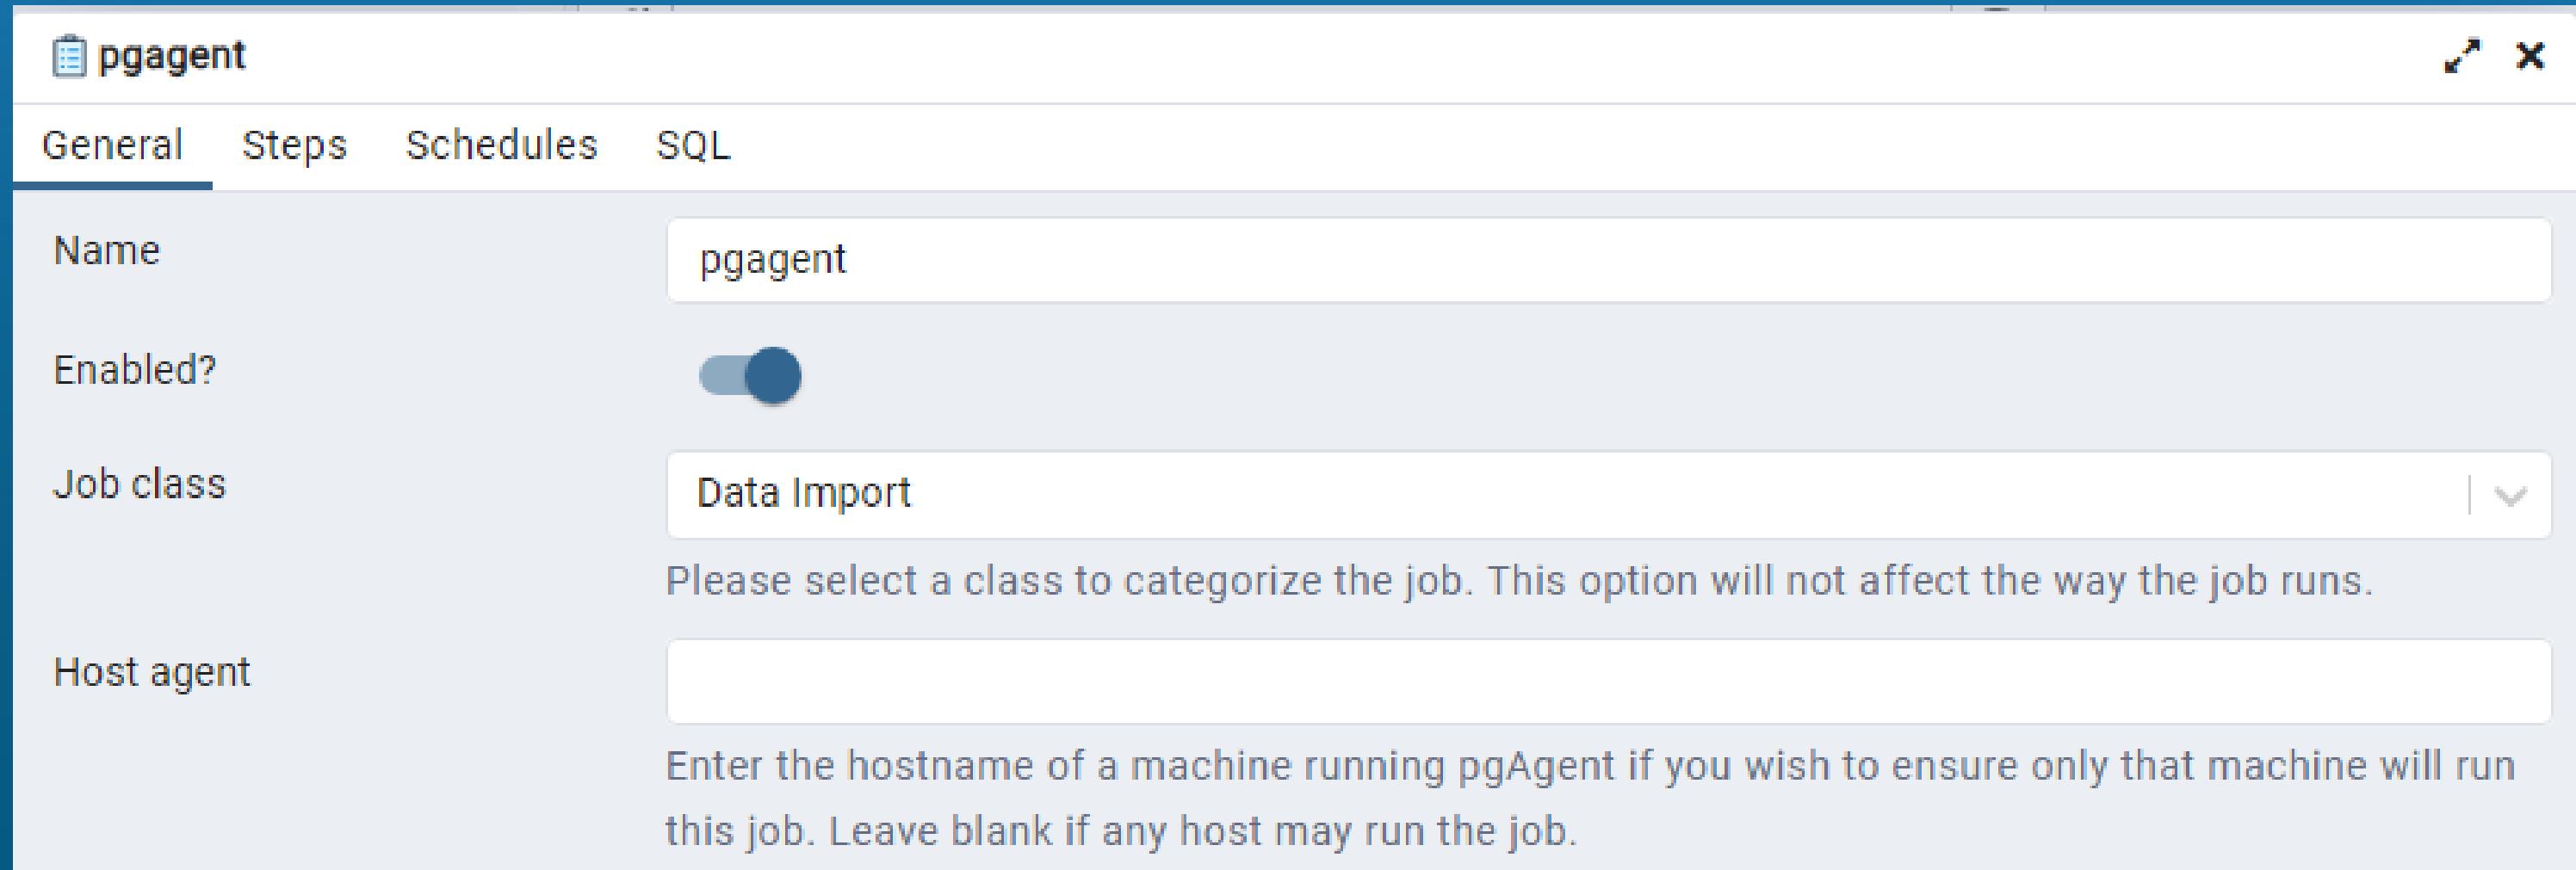

Tables (1)

- raw_data

| | w_temperature double precision | wind_speed double precision | w_humidity double precision | wind_direction double precision | solar_radiation double precision |
|---|-----------------------------------|--------------------------------|--------------------------------|------------------------------------|-------------------------------------|
| 1 | 37.50818659144495 | 19.870317969893357 | | 60 | 299.5789644899922 |
| 2 | 17.125175657123727 | 1.495384839464664 | | 54 | 269.16792491312094 |
| 3 | 29.222790670553273 | 14.508518157274528 | | 51 | 125.02904192657596 |

| sensor_id [PK] integer | soil_moisture_content double precision | soil_ph_levels double precision | soil_temperature double precision | soil_nutrient_levels character varying (10) |
|---------------------------|---|------------------------------------|--------------------------------------|--|
| 1 | 34.976367805933165 | 6.026315932107942 | 9.785870049288185 | N |
| 2 | 20.8926517072365 | 6.951530980908673 | 16.554476617225312 | K |
| 3 | 48.75662559204609 | 5.811128472497669 | 17.545042149707164 | K |

04

We are building a pagent for databaseB to automatically download information. First, we fill in the "general" part.

04...

| | Name | Enabled? | Kind | Connection type | On error |
|--|---------|-------------------------------------|------|-----------------|----------|
| | pgagent | <input checked="" type="checkbox"/> | SQL | Local | Fail |

General **Code**

Name: pgagent

Enabled?:

Kind: SQL Batch

Connection type: Local Remote

Select **Local** if the job step will execute on the local database server, or **Remote** to specify a remote database server.

Database: databaseB

Please select the database on which the job step will run.

In the code section, we write the code we want to repeat automatically.

Then we fill in the "steps" part. In this section, we specify which database we will use pgagent.

| | Name | Enabled? | Kind | Connection type | On error |
|--|---------|-------------------------------------|------|-----------------|----------|
| | pgagent | <input checked="" type="checkbox"/> | SQL | Local | Fail |

General **Code**

```
1 SELECT populate_raw_data();
```

04...

Then we fill in the "schedules" field. In this section, I record the start and end time of pgagent.

| Name | Enabled? | Start | End |
|---------|-------------------------------------|---------------------|------------------|
| pgagent | <input checked="" type="checkbox"/> | 2023-09-06 19:35:14 | YYYY-MM-DD HH:mm |

General Repeat Exceptions

Name: pgagent
Enabled?:
Start: 2023-09-06 19:35:14 +04:00
End: YYYY-MM-DD HH:mm:ss Z

Days

Week Days: Sunday, Monday, Tuesday, Wednesday, Thursday, Friday
Saturday

Month Days: 1st, 2nd, 3rd, 4th, 5th, 6th, 7th, 8th, 9th, 10th, 11th, 12th, 13th, 14th, 15th, 16th, 17th, 18th, 19th, 20th, 21st, 22nd, 23rd, 24th, 25th, 26th, 27th, 28th, 29th, 30th, 31st, Last day

In the next section, we specify the dates we want the pgagent to be active. (Months, Years, Days, Hours, Minutes)

POWER BI

05

The screenshot shows the 'Data' tab selected in the Power BI ribbon. A search bar at the top contains the text 'Database'. The main pane lists various database types:

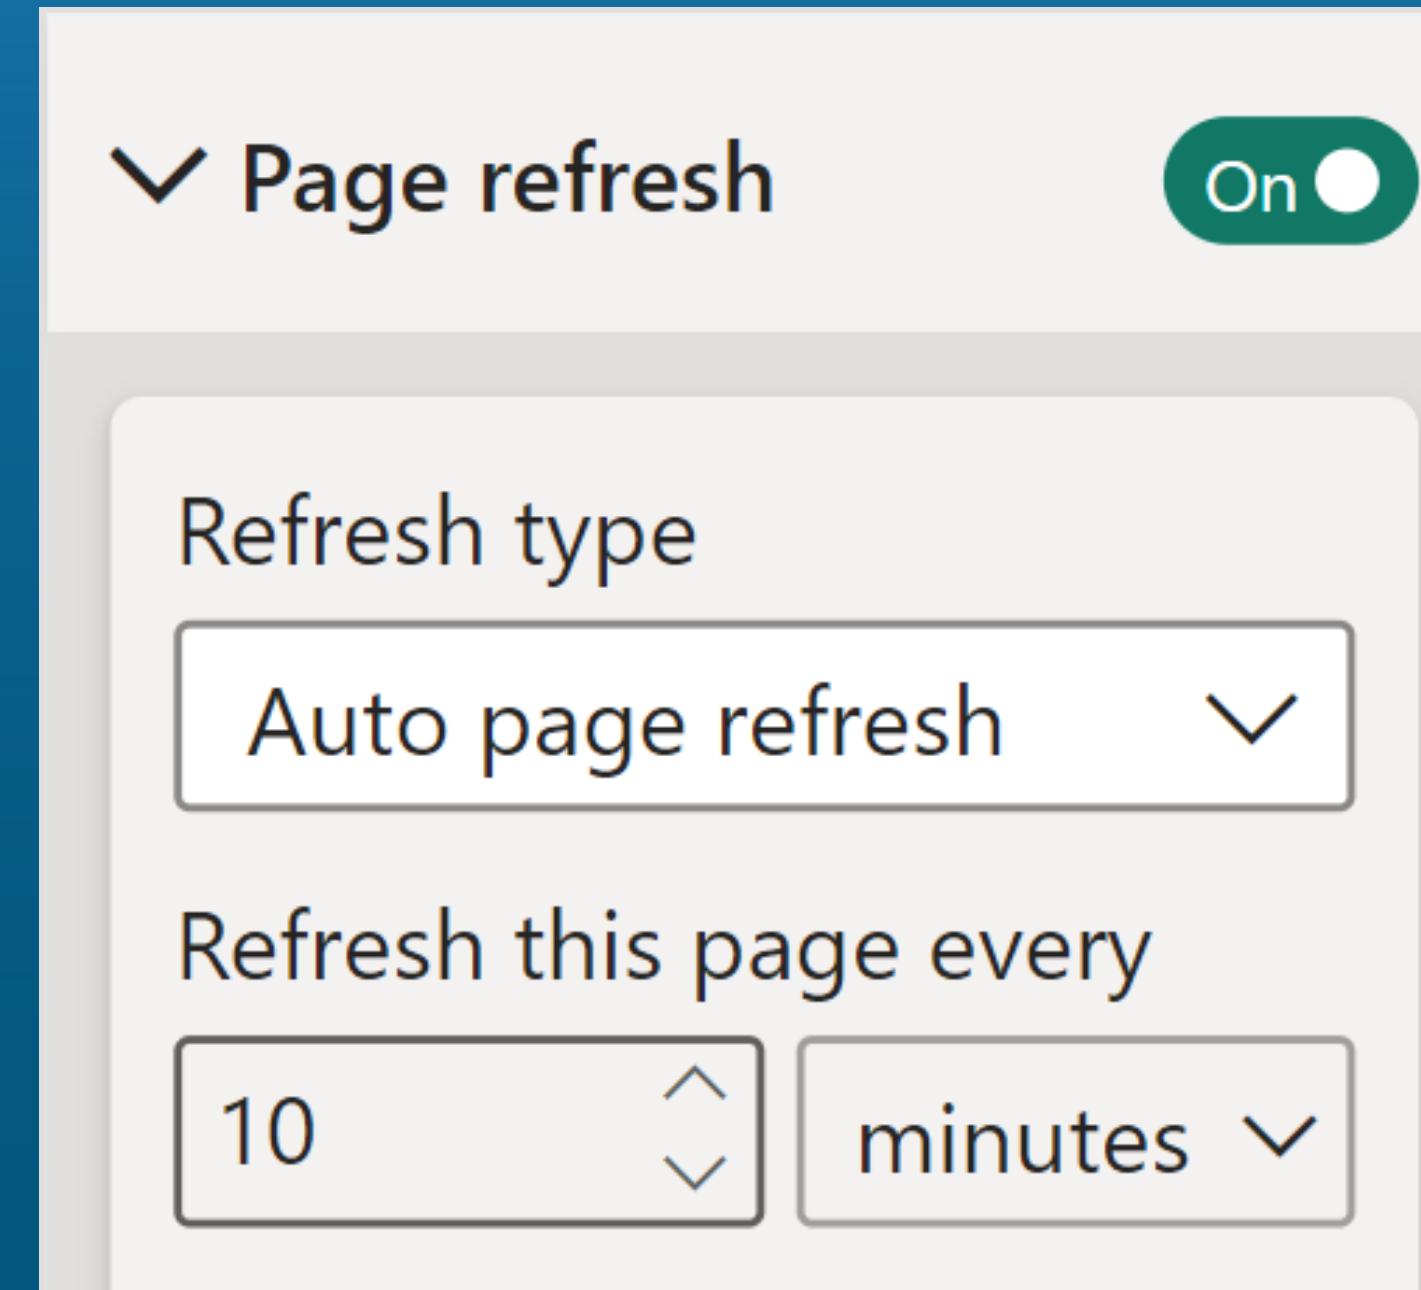

- SQL Server database
- Access database
- SQL Server Analysis Services database
- Oracle database
- IBM Db2 database
- IBM Informix database (Beta)
- IBM Netezza
- MySQL database
- PostgreSQL database** (highlighted with a black underline)
- Sybase database

A tooltip on the right side of the PostgreSQL entry states: "We enter the data in DatabaseB into Power Bi. Accordingly, we select the PostgreSQL share."

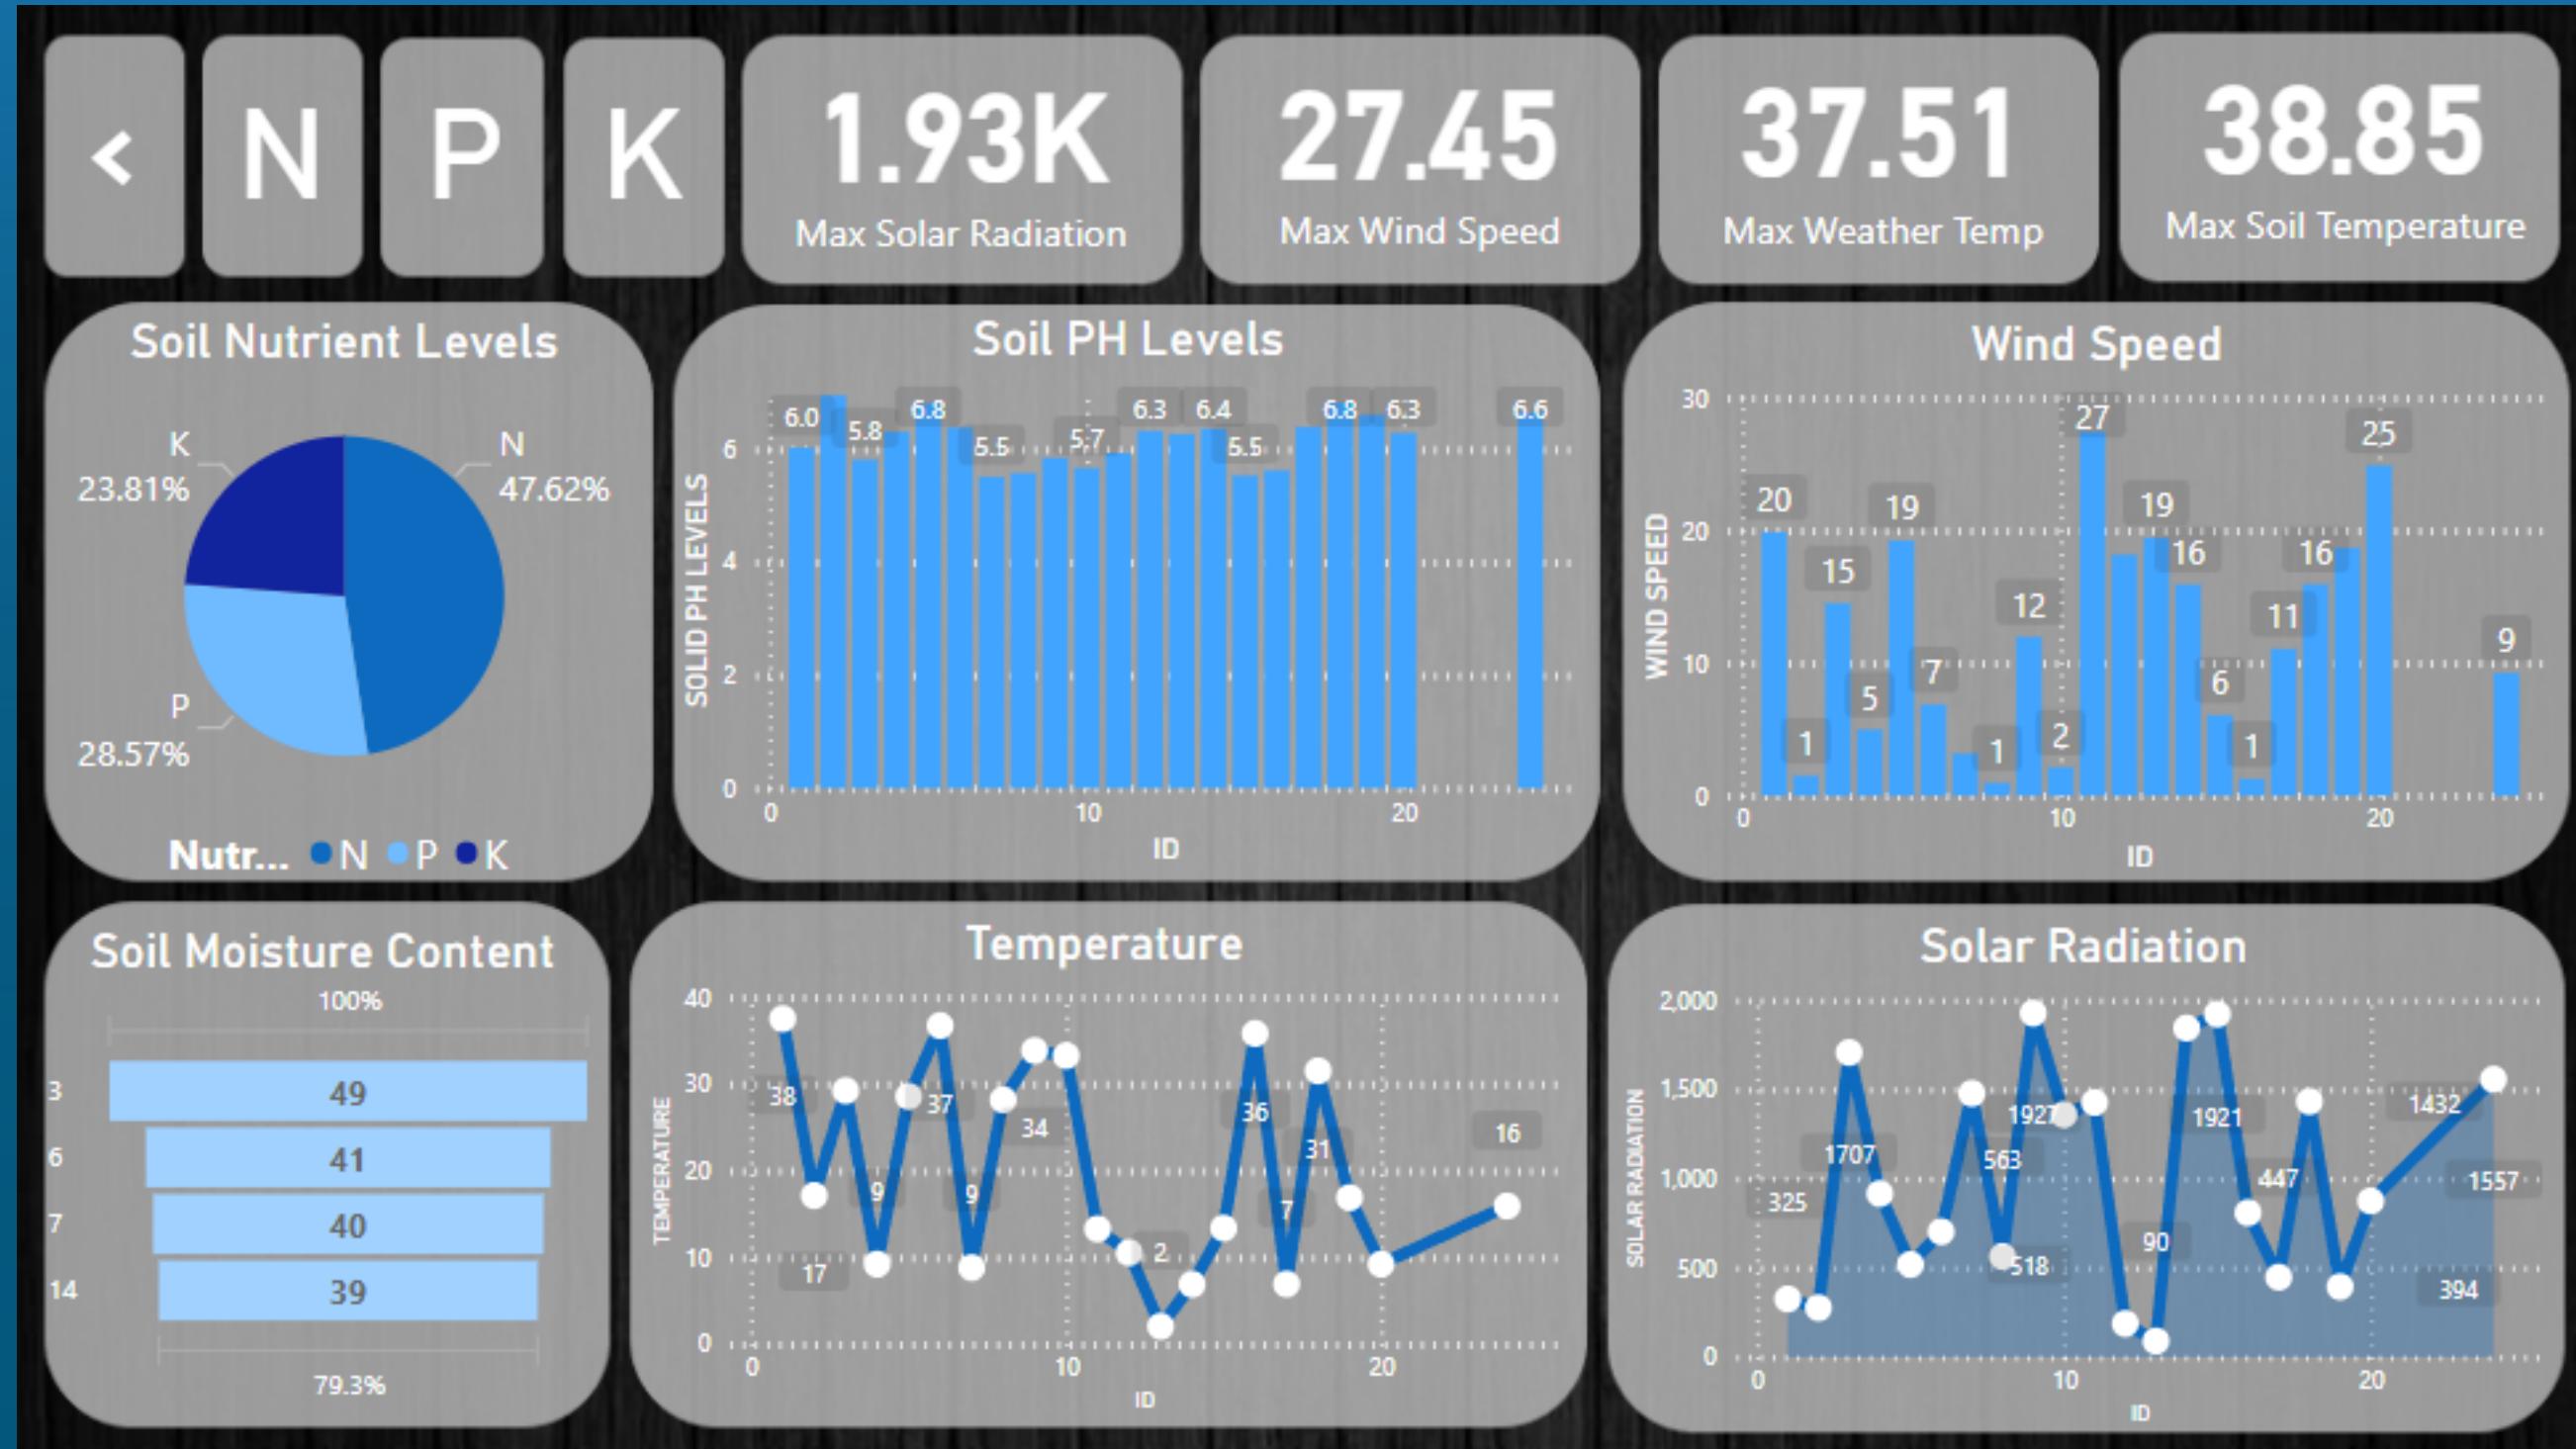

We enter the data in
DatabaseB into Power Bi.
Accordingly, we select the
PostgreSQL share.

05...

Finally, I fix the "page refresh" section. In this section I set the time for automatic update.

06

Finally, we prepare a dashboard using PowerBI to visualize the data.

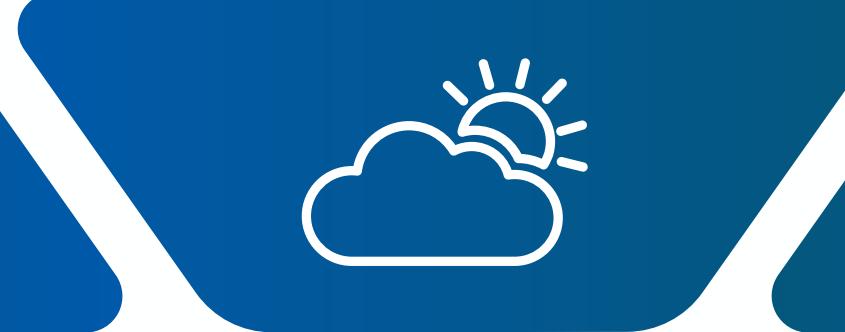

BUSINESS SIDE

BUSINESSES

AGRICULTURE AND FARMING

01

WEATHER FORECASTING

02

ENVIRONMENTAL MONITORING

03

SMART AGRICULTURE SOLUTIONS

04

01

AGRICULTURE AND FARMING

- Optimizing irrigation based on soil moisture levels.
- Managing soil conditions (pH, temperature, nutrient levels) to improve crop yields.
- Reducing resource usage (water, fertilizers) through data-driven decisions.

02

- Parameters such as temperature, wind speed, humidity, wind direction, and solar radiation.
- Industries : 1. meteorological agencies, 2. research institutions, and 3. businesses.

WEATHER FORECASTING

03

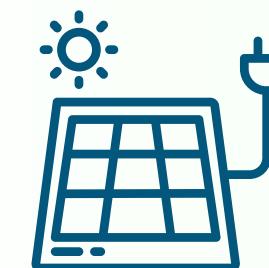

ENVIRONMENTAL MONITORING

- Sensor data is pivotal for understanding environmental dynamics. It helps us monitor weather impacts on soil health and climate change effects.
- Long-term data collection supports informed decisions and environmental protection.

04

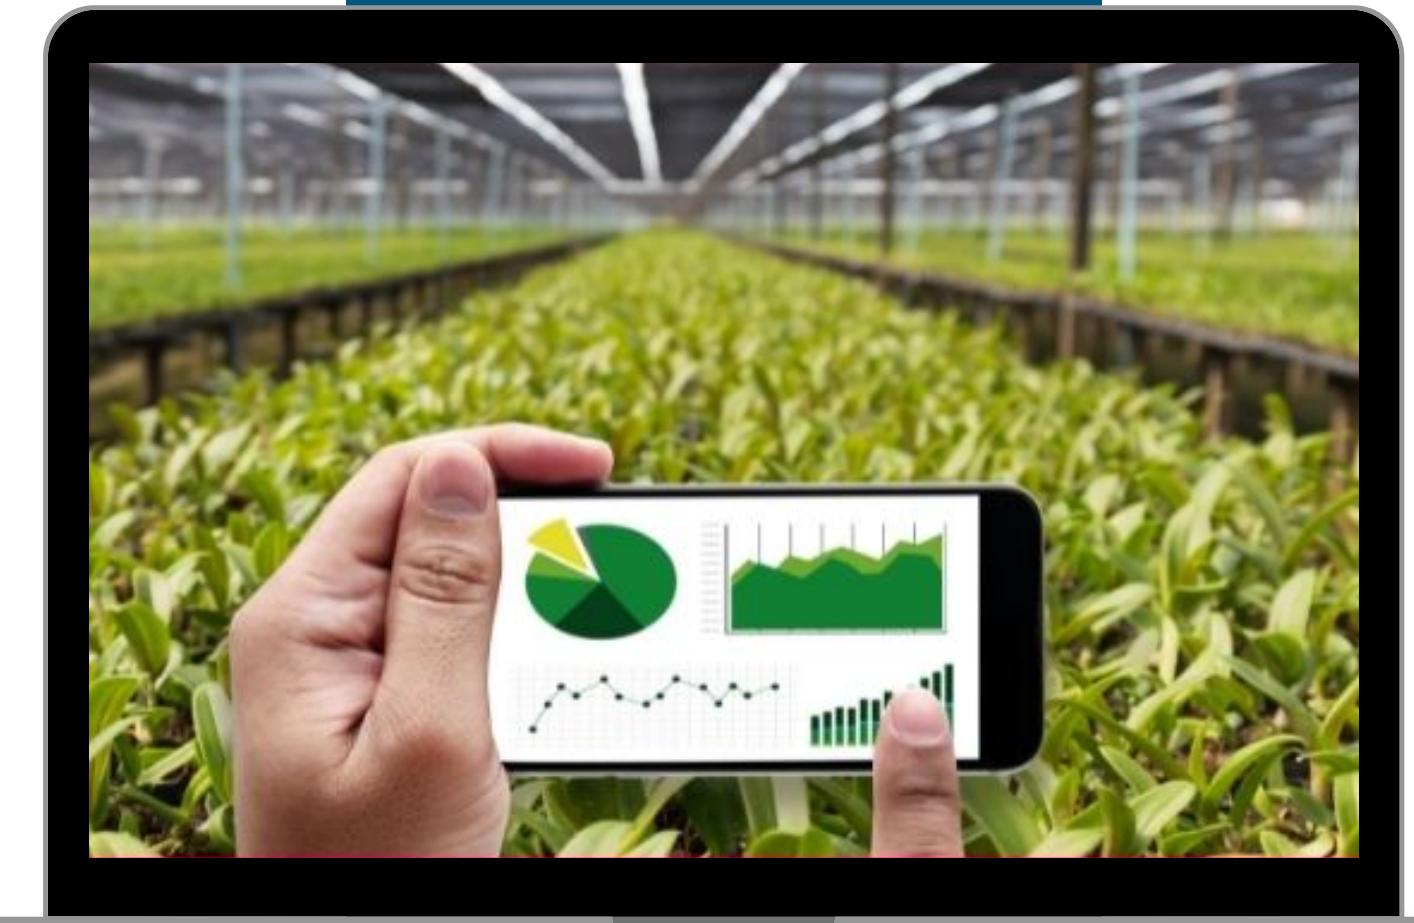

- Smart agriculture solutions provide real-time data to farmers and offer data-driven recommendations for crop management, pest control, and irrigation.
- These innovations enhance efficiency and profitability in agriculture, empowering farmers with actionable insights for optimal decision-making.

SMART AGRICULTURE SOLUTIONS

CONCLUSION

- In summary, our sensor data project opens doors to smarter, more sustainable practices in agriculture and environmental monitoring. With real-time insights and data-driven solutions, we can enhance efficiency and make informed decisions, ultimately contributing to a greener and more productive world.
